

RECITATION: DECOMPOSING REQUIREMENTS

Christian Kaestner

Slides adopted from Eunsuk Kang

THE ROLE OF REQUIREMENTS ENGINEERING

- Requirements engineering essential to understand risks and mistake mitigation
- Understand
 - user interactions
 - safety requirements
 - security and privacy requirements
 - fairness requirements
 - possible feedback loops

MACHINE VS WORLD

- No software lives in vacuum; every system is deployed as part of the world
- A requirement describes a desired state of the world (i.e., environment)
- Machine (software) is *created* to manipulate the environment into this state

SHARED PHENOMENA

- Shared phenomena: Interface between the world & machine (actions, events, dataflow, etc.,)
- Requirements (REQ) are expressed only in terms of world phenomena
- Assumptions (ENV) are expressed in terms of world & shared phenomena
- Specifications (SPEC) are expressed in terms of machine & shared phenomena

TASK 1: MACHINE VS WORLD

Task: In groups, identify Requirements, Assumptions and Specifications for (1) Amazon product recommendations, (2) predictive policing, (3) screening applicants for Masters program

WHAT COULD GO WRONG?

- Missing/incorrect environmental assumptions (ENV)
- Wrong specification (SPEC)
- Inconsistency in assumptions & spec ($ENV \wedge SPEC = \text{False}$)
- Inconsistency in requirements ($REQ = \text{False}$)

NON-AI EXAMPLE: LUFTHANSA 2904 RUNWAY CRASH

- Reverse thrust (RT): Decelerates plane during landing
- What was required (REQ): RT enabled if and only if plane on the ground
- What was implemented (SPEC): RT enabled if and only if wheel turning
- But: Runway wet + wind, wheels did not turn, pilot overridden by software

FEEDBACK LOOPS AND ADVERSARIES

- Feedback loops: Behavior of the machine affects the world, which affects inputs to the machine
- Data drift: Behavior of the world changes over time, assumptions no longer valid
- Adversaries: Bad actors deliberately may manipulate inputs, violate environment assumptions

TASK 2: IDENTIFY POTENTIAL PROBLEMS

- Missing/incorrect environmental assumptions (ENV)
- Wrong specification (SPEC)
- Inconsistency in assumptions & spec ($ENV \wedge SPEC = \text{False}$)
- Inconsistency in requirements ($REQ = \text{False}$)
- Resulting in problems with feedback loops, data drift, adversaries

Task: In groups, identify examples of problems in (1) Amazon product recommendations, (2) predictive policing, (3) screening applicants for Masters program
